A Practical Guide to Living with Urban Gulls

North Ayrshire Council
Comhairle Siorrachd Àir a Tuath
The Gull Problem

A growing number of Lesser Blackback and Herring gulls now build nests on the roofs of homes and businesses in towns across North Ayrshire, rather than on coastal cliffs.

Herring gulls are large; around 55cm (22”) from bill to tail with a wingspan of 85cm (34”) when mature. They have silver-grey wings, pink legs and a yellow beak with a red spot. Lesser Blackback gulls are slightly smaller, with dark grey to black back and wings, a yellow bill and yellow legs.

Life in town is easy for the birds - some people deliberately feed them and discarded food provides a feast. Our roofs are warm, chimneys provide shelter, and streetlights mean they can even feed at night.

Problems include:

• Noise - raucous calls and squabbling start at dawn and go on all day
• Mess caused by droppings, and the litter strewn from bins as they scavenge
• Damage to property and corrosion of vehicles
• Attacks on people and pets

Although some gulls live in town all year, problems are more serious during the breeding season when more birds arrive.
Gulls begin mating in April and nest from early May onwards. Courtship is noisy, and raucous calls can disturb people in nearby buildings all day. Two or three eggs are laid, taking 3-4 weeks to hatch.

The first chicks appear in early June. At this stage, parents can become aggressive in defending their nests. Chicks grow quickly and stay in the nest for 5-6 weeks. Some fall out and cannot return to safety, so parents protect them by diving and swooping on anyone who approaches, which can be frightening.

Young gulls begin to fly in late July/early August. Aggression increases as they squabble over food and noise nuisance gets worse. It can be hard for the birds to find enough to eat, often attacking people carrying food in the street by swooping down low, aiming to frighten their victim, before stealing the food and making off. People have been injured by sharp beaks and claws and domestic pets can be attacked.

Gulls are clever and learn from each other. They choose vulnerable targets, meaning children and elderly people are most at risk. By early September, young birds disperse and head out to sea. Most of the parents leave too, returning the next year.

**Tackling the Nuisance**

It takes four years for a gull to reach maturity and breed, and many return to nest where they were born. Gulls like to nest in colonies and once a pair gains a foothold others follow. If they breed successfully, they will return year on year and problems will grow rapidly.
There is no quick fix to the problem of nuisance gulls, and control measures need to be kept up for several years to be effective. The key lies in reducing their ability to breed successfully and limiting the supply of food. Gulls pair and mate for life but if they fail to rear chicks they will split up.

Action needs to be planned early in the year as once the chicks have hatched it’s too late to do much to reduce bird numbers.

**The Law**

Under the Wildlife and Countryside Act 1981, it is illegal to capture, injure or destroy any wild bird, or interfere with its nest or eggs. Penalties can be severe. However, the law also provides a general licence system, which allows property owners to take action against gulls nesting on buildings by destroying nests or eggs.

This can ONLY be used for the purpose of preserving public health, public safety, and preventing the spread of disease and is specifically for the control of Herring, Black Backed and Lesser Black Backed gulls.

If action is taken for any other reason, or if other species of gull are targeted, then an offence is committed. More information can be found on Scottish Natural Heritage’s website: [http://bit.ly/SNHgulls](http://bit.ly/SNHgulls)

Only an owner or occupier can take action against gulls nesting on buildings, but they can give someone else permission to act on their behalf.
Any action taken must be humane and should only be used where scaring or proofing is either ineffective or impracticable. **Any method that could cause suffering is illegal.** The use of poisons or drugs to take or kill any bird is specifically prohibited, except under very special circumstances and with a government licence, received in advance.

Although herring gulls can be killed under the general licence, this can only be done to protect public health, prevent serious damage to agriculture or to conserve wild birds.

**The Council’s policy is not to kill or harm live gulls or chicks.**

North Ayrshire Council has no statutory duty to take action against gulls, but does recognise the need to protect communities. However, the Council cannot do this alone, and everyone has a role to play in preventing problems.
How YOU Can Help

1. **DO NOT FEED GULLS** or drop food scraps as this encourages them to stay in residential areas. Gulls are scavengers and will feed on discarded litter and waste so put refuse in secure, enclosed containers. Dropping litter or food scraps is an **offence** and you may be liable to a **penalty**.

   Please be a good neighbour, and don’t attract gulls to your garden to feed. While the wish to help wildlife is understandable, this is not in the birds’ best interests. Their natural diet is based on shellfish and other small sea creatures, bird eggs, insects and earthworms. Too much human food is not good for them, and if you feed them regularly they will expect everyone to do the same. From there, it is only a short step to attacking people and stealing food. Your kindness could lead to other people being frightened or injured, and a diet of scraps and fast food is bad for the birds’ long-term health.

2. In spring, owners or occupiers should check the roofs of premises regularly for signs of nest building. Tenants should report nests to their landlord as soon as they are seen. If possible, the property owner should arrange to have the nest or eggs removed, using a licensed contractor.

3. Property owners can discourage gulls from nesting by erecting deterrent devices on chimney heads, flat roof areas, and other possible nesting sites.

   If all owners of buildings which have (or may attract) roof-nesting gulls took appropriate measures, it would be easier to reduce or break up the gull colonies, and the whole community would benefit.
The principle deterrent methods include:
- Fitting long spikes to places like chimney stacks
- Fitting short spikes to dormer roofs
- Fitting wires or nets to prevent gulls landing
- Disturbance of nesting sites, including removal of nests and eggs

If you have a problem with gulls nesting on your property, you can contact a specialist company for advice or a quotation. Due to the risk of trapping, nets should only be used after taking advice from a competent specialist.

4. If gulls nest on your property, you can arrange through a competent specialist working under the appropriate licence for eggs to be pierced or oiled to prevent hatching, or have them removed and replaced with imitation eggs.

**Safety First**
Work on roofs should only be carried out by a competent person aware of safety requirements. All roof fixtures should be suitable for the specific roof and not constitute a safety or fire risk.
